Tool Type	Flint Type				Summary of Selected Data																						
	Translucent	Wolds	Drift																								
Scrapers (overall)	9%	36%	55%	<ul style="list-style-type: none"> • Almost 1/3 of all scrapers are exaptively used-through burinations: see scraper-burins. • Tool blanks: flakes & blades, but also overshots and core rejuvenation pieces used as blanks reflects economising strategies. • The high percentage of reduction for scrapers suggests economising behaviour. This in turn may infer pressure on resources. • The high percentage of cortical drift flint possibly infers ad hoc use? 	<table border="1"> <thead> <tr> <th>% scrapers</th> <th>Translucent</th> <th>Wolds</th> <th>Drift</th> </tr> </thead> <tbody> <tr> <td>Cortex</td> <td>56%</td> <td>17%</td> <td>47%</td> </tr> <tr> <td>Non Cortical</td> <td>44%</td> <td>83%</td> <td>53%</td> </tr> <tr> <td>*scraper burins</td> <td>≈32%</td> <td>≈37%</td> <td>32%</td> </tr> </tbody> </table>				% scrapers	Translucent	Wolds	Drift	Cortex	56%	17%	47%	Non Cortical	44%	83%	53%	*scraper burins	≈32%	≈37%	32%

End scrapers	<ul style="list-style-type: none"> • The variation in end scraper size in all materials (right) seems to be consistently low with a small standard error. Although the small translucent flint sample may have skewed the results. • The standard errors are broadly acceptable- which suggests the results are safe. • The similar sizes for all materials suggest a formal mental design. It is interesting then that some pieces that were then used flexibly – equipotentiality- and burinated! • The makers were clearly selecting the larger more 'usable pieces' as blanks for burins. 			<table border="1"> <thead> <tr> <th>Tool/Mean</th> <th>Length</th> <th>Width</th> <th>Depth</th> </tr> </thead> <tbody> <tr> <td>end scrapers</td> <td>35.75mm</td> <td>22.8mm</td> <td>7.56mm</td> </tr> <tr> <td>end scraper burins</td> <td>46.88mm</td> <td>22.36mm</td> <td>7.91mm</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>% end scrapers</th> <th>Translucent</th> <th>Wolds</th> <th>Drift</th> </tr> </thead> <tbody> <tr> <td>* end scraper burins</td> <td>25%</td> <td>≈33%</td> <td>≈30%</td> </tr> </tbody> </table>				Tool/Mean	Length	Width	Depth	end scrapers	35.75mm	22.8mm	7.56mm	end scraper burins	46.88mm	22.36mm	7.91mm	% end scrapers	Translucent	Wolds	Drift	* end scraper burins	25%	≈33%	≈30%

Figure 4b. Star Carr Formal Tools Technological Attributes Analyses Summary

Tool Type	Flint Type			Summary of Selected Data																																												
	Translucent	Wolds	Drift																																													
Burins	11%	34%	55%	<ul style="list-style-type: none"> This data includes the scraper-burins and awl burins. 51% of burins are equipotential (i.e. tools chosen as a blank for burination). Most of these (55%) are burinated-end scrapers, 44% of Awls & other exaptive-burin types 1>%. 49% of burins are on a 'clean' unused blank. The high proportion of cortex suggests economising strategies. The cortex groups represented suggest that translucent blanks were struck from the mid to later stages of reduction. Whereas wolds- later. Burins were predominantly made on blades. Of burins proper & other burinated tools: 67% have one facet, and 32% have multiple facets. This could represent retooling or exaptive tool use. It is thus striking the amount of exaptive tool use if we combine multiple facets with the exaptive tools by blank choice (e.g. scraper-burin): (see right). The location of retouch differs between the exaptive and non-exaptive burins. For example: on scraper-burins the burinations are on retouch and rarely on natural edges (which lends weight to the exaptive interpretation). On single proper burins the burination facets are generally on natural edges and some retouched. Generally burin size (all categories) is consistent: Length 45-7mm, Width 22mm and depth 9-9mm. Although as a rule wolds burins are marginally larger. <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>% Burins</th> <th>Translucent</th> <th>Wolds</th> <th>Drift</th> </tr> </thead> <tbody> <tr> <td>Cortex</td> <td>42%</td> <td>19%</td> <td>58%</td> </tr> <tr> <td>Non Cortical</td> <td>58%</td> <td>81%</td> <td>42%</td> </tr> </tbody> </table> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>% Burins</th> <th>Translucent</th> <th>Wolds</th> <th>Drift</th> </tr> </thead> <tbody> <tr> <td>*Scraper-Burins</td> <td>39%</td> <td>57%</td> <td>47%</td> </tr> <tr> <td>*Awl-Burins</td> <td>≈3%</td> <td>2%</td> <td>2%</td> </tr> <tr> <td>Equipotential by blank choice</td> <td>42%</td> <td>58%</td> <td>49%</td> </tr> <tr> <td>Burins (non-equipotential)</td> <td>58%</td> <td>42%</td> <td>51%</td> </tr> </tbody> </table> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>% Burins</th> <th>Translucent</th> <th>Wolds</th> <th>Drift</th> </tr> </thead> <tbody> <tr> <td>Burins (non-equipotential)</td> <td>28%</td> <td>23%</td> <td>30%</td> </tr> <tr> <td>Total Equipotential Burins‡</td> <td>72%</td> <td>77%</td> <td>70%</td> </tr> </tbody> </table>	% Burins	Translucent	Wolds	Drift	Cortex	42%	19%	58%	Non Cortical	58%	81%	42%	% Burins	Translucent	Wolds	Drift	*Scraper-Burins	39%	57%	47%	*Awl-Burins	≈3%	2%	2%	Equipotential by blank choice	42%	58%	49%	Burins (non-equipotential)	58%	42%	51%	% Burins	Translucent	Wolds	Drift	Burins (non-equipotential)	28%	23%	30%	Total Equipotential Burins‡	72%	77%	70%

Total Exaptive/Equipotential Tools				<ul style="list-style-type: none"> 17% of Formal Tools at Star Carr = Exaptive/Equipotential. 	<ul style="list-style-type: none"> 83% of Formal Tools at Star Carr = Non-Exaptive/Non-Equipotential. 																																											

Note: The technological attributes analysis that is summarised in this table was undertaken just on the formal tools (Preston 1999). Thus the results are only tentative. A full reanalysis of Clark's (1954) assemblage is needed, as comparisons of the non-formal tools, debitage and cores would be particularly useful.

Symbols: * = Equipotential. # = equipotential or retooling depending on the morphology. ‡ includes Exaptive pieces by: blank choice alone, multiple burinations alone & both multiple facets on a reused tool (exaptive by blank choice)
